col19
! PROGRAMMED BY C.C.TSCHERNING, NIELS BOHR INSTITUTE, UNIVERSITY
! OF COPENHAGEN, DENMARK.
! LAST UPDATE: 2014-02-14 BY CCT.  UNIX VERSION.
! THE PROGRAM IS COPYRIGHT BY THE AUTHOR  FIRST TIME 1975,
! AND LATEST 2014. IT MAY BE COPIED AND TRANSFERRED TO
! NON-COMMERCIAL USERS ON THE CONDITION THAT THE AUTHOR IS NOTIFIED.
! THIS WILL ASSURE THAT USERS ARE INFORMED IF FATAL ERRORS ARE FOUND.
! COMMERCIAL USERS MUST OBTAIN A LICENCE FROM THE COPYRIGHT OWNER
! BEFORE USING THE PROGRAM OR PARTS OF THE PROGRAM.
! A FILE HTTP://CCT/GFY.KU.DK/GEOCOL19.LOG CONTAINS A RECORD OF SUSPECTED
! AND CORRECTED ERRORS, UPDATES AND PLANNED UPDATES.
!
! THE PRIMARY FUNCTION OF THE PROGRAM IS TO COMPUTE AN APPROXIMATION TO
! THE ANOMALOUS POTENTIAL OF THE EARTH USING STEPWISE LEAST SQUARES
! COLLOCATION, CF. REF (B) AND THE DETERMINATION OF RELATED PARAMETERS
! SUCH AS DATUM-SHIFTS, SEE REF. (E).
! WHEN THE APPROXIMATION HAS BEEN DETERMINED, IT MAY BE USED TO PREDICT
! VARIOUS QUANTITIES AND ESTIMATE ERROR AND ERROR CORRELATIONS, SEE TABLE 1.
! SECONDARY FUNCTIONS ARE (A) THE REMOVAL OR SUBTRACTION OF THE
! CONTRIBUTION FROM A SPHERICAL HARMONIC EXPANSION (SHE) AND (B)
! THE COMPUTATION OF EFFECTS OF A DATUM SHIFT.
! THE COLLOCATION METHOD REQUIRES THE SPECIFICATION OF
! (1) ONE OR TWO (AND IN A SPECIAL CASE) THREE SETS OF OBSERVED
! QUANTITIES WITH KNOWN STANDARD DEVIATIONS AND
! (2) ONE OR TWO COVARIANCE FUNCTIONS, CF. REF (A).
!
! THE COVARIANCE FUNCTIONS USED ARE ISOTROPIC. THEY ARE SPECIFIED
! BY A SET OF EMPIRICAL ANOMALY DEGREE-VARIANCES OF DEGREE LESS
! THAN AN INTEGER VARIABLE IMAX, AND BY AN ANOMALY DEGREE-VARIANCE
! MODEL FOR THE DEGREE-VARIANCES OF DEGREE GREATHER THAN IMAX.
!
! THE OBSERVATIONS MAY BE POTENTIAL COEFFICIENTS, MEAN OR POINT
! GRAVITY ANOMALIES, HEIGHT ANOMALIES, VALUES OF THE ANOMALOUS
! POTENTIAL, DEFLECTIONS OF THE VERTICAL, GRAVITY GRADIENTS AND
! DENSITY CONTRASTS. THE ABSOLUTE QUANTITIES, I.E. THE SAME ASSOCIATED
! FUNCTIONALS APPIED ON THE FULL POTENTIAL (V OR W) MAY ALSO
! BE USED IN CERTAIN CIRCUMSTANCES.  A FILTERING TAKES
! PLACE SIMULTANEOUSLY WITH THE DETERMINATION OF THE ANOMALOUS
! POTENTIAL.
!
! THE OBSERVATIONS MAY BE GIVEN IN A LOCAL (E.G. INSTRUMENTAL) FRAME
! IN WHICH CASE ATTITUDE INFORMATION MUST BE INPUT. THEY MAY ALSO
! HAVE CORRELATED ERRORS, IN WHICH CASE THE ERROR-COVARIANCE FUNCTION
! MUST BE DEFINED.
!
! THE DETERMINATION IS MADE IN A NUMBER OF STEPS EQUAL TO THE NUMBER OF
! SETS OF OBSERVATIONS. WHEN POTENTIAL COEFFICIENTS ARE USED, WILL THE-
! ESE FORM A SEPARATE SET. CONTRIBUTIONS FROM A TERRAIN POTENTIAL MAY
! NOT BE COMPUTED BY THIS VERSION, BUT MAY BE INPUT AND WILL THEN BE
! ADDED TO OR SUBTRACTED FROM THE VARIOUS QUANTITIES.
! EACH DATASET (EACH STEP) WILL DETERMINE A HARMONIC FUNCTION, AND THE
! ANOMALOUS POTENTIAL WILL BE EQUAL TO THE SUM OF THEESE (MAXIMALLY
! FOUR) FUNCTIONS.
!
! POTENTIAL COEFFICIENTS WILL DETERMINE A FUNCTION EQUAL TO THE COEFFI-
! CIENTS MULTIPLIED BY THE CORRESPONDING SOLID SPHERICAL HARMONICS. THE
! UP TO TWO SETS OF DATA DIFFERENT FROM POTENTIAL COEFFICIENTS WILL
! EACH BE USED TO DETERMINE CONSTANTS B(I). THE CORRESPONDING HARMONIC
! FUNCTIONS ARE THEN EQUAL TO THEESE CONSTANTS MULTIPLIED BY THE COVA-
! RIANCE BETWEEN THE OBSERVATIONS AND THE VALUE OF THE ANOMALOUS POT-
! ENTIAL IN A POINT, P.
!
! THE PROGRAM  WILL COMPUTE, THE CONSTANTS B(I) AND PREDICT QUANTITIES
! ZETA, KSI, ETA, DELTA G, GRAVITY GRADIENTS, DENSITY CONTRASTS IN POINTS Q,
! AND THE ERRORS OF PREDICTION.
```

```
!
! CORRECTIONS TO A SET OF SPHERICAL HARMONICS MAY ALSO BE COMPUTED,
! CF. REF (H).
!
! DATUM-SHIFT PARAMETERS MAY BE DETERMINED BY THE PROGRAM IN THE
! FORM OF THE CHANGE IN THE LONGITUDE AND LATITUDE COMPONENTS OF THE DE-
! DEFLECTION OF THE VERTICAL AND OF THE HEIGHT-ANOMALY IN A POINT WITH
! GIVEN LATITUDE AND LONGITUDE, CF. REF(E), OR ONE ORE MORE OF THE
! PARAMETERS OF A 7-PARAMETER DATUM SHIFT. IN THIS CASE OBSERVATIONS
! OF THE DIFFERENCE BETWEEN GEOCENTRIC AND LOCAL GEODETIC COORDINATES
! MAY BE USED.
!
! BIAS, TILT AND SCALE-FACTOR PARAMETERS MAY ALSO BE DETERMINED.
! FOURIER COEFFICIENTS ARE BEING IMPLEMENTED, APRIL 2006.
!
! THE DATA USED TO CREATE ONE SOLUTION MAY BE PRESERVED AND USED IN
! ORDER TO REESTABLISH THE SOLUTION OR AS A BUILDING STONE FOR A
! NEW SOLUTION. IN THE FIRST CASE A LOGICAL VARIABLE LWRSOL MUST BE
! TRUE AND IN THE SECOND CASE MUST THE VARIABLE LRESOL BE TRUE.
! THIS VERSION OF THE PROGRAM IS WRITTEN IN FORTRAN95, and split into
! MODULES: MAIN PROGRAM geocol19.f90, and modules m_cholsol.f90
! FOR CHOLESKY REDUCTION USING CHUNKS, AND m_data.f90, m_params.f90.

```

```
!                                                                  SCALE FACTOR
! ------------------------------------------------------------------------------
! IF CODE 13 IS USED FOR GRAVITY, SPHERICAL APPROXIMATION IS USED,
! AND IF CODE 2 IS USED, THE POTENTIAL COEFFICIENT SET APPROXIMATION
! IS USED. CODE 13 IS RECOMMENDED IN GENERAL.
! CODES .GT. 40 INDICATE THAT A QUANTITY IS GIVEN IN A LOCAL REFERENCE
! SYSTEM, EAST/NORTH/UP. A LOGICAL VARIABLE LSATP IS PUT TRUE AND AN
! INTEGER ISAT IS INPUT EQUAL TO 1 IF  A ROTATION IN THE HORIZONTAL PLANE
! IS NEEDED, (THEN AZIMUTM MUST BE GIVEN), EQUAL TO 2, 3 OR  4 IF A 3D
! ROTATION IS NEEDE. IF ISAT = 1 THE AZIMUTH MUST BE INPUT.
! IF ISAT = 2 THE AZIMUTH, TILT AND ROLL ANGLES MUST BE INPUT,
! IF ISAT = 3 NO ROTATION IS MADE, AND IF ISAT = 4, THE FULL
! ROTATION MATRIX MUST BE INPUT.
!
! NOTE, THAT IT IS OF ADVANTAGE TO USE OR COMPUTE PAIRS OF QUANTITIES
! BECAUSE COVARIANCES OR CONTRIBUTIONS FROM SPHERICAL HARMONIC EXPAN-
! SIONS MAY BE COMPUTED SIMULTANEOUSLY FOR THESE QUANTITIES.
!
! ------------------------------------------------------------------------------
! TABLE 2:  FILES NEEDED FOR RUNNING THE PROGRAM:
! UNIT NUMBER  USED FOR                          TEMPORARY/PERMANENT

!        AND PERMANENT IF LBIPOT IS SET TRUE                  YES
!  2     TEMPORARY STORAGE OF CONTRIBUTIONS FROM      YES
!        DATA ONLY ASSOCIATED WITH PARAMETERS.
!  4 OR DIFFERENT FROM OTHER UNIT NUMBERS, INPUT OF
!        DATA IF LIN4 IS TRUE                         YES
! 12     FILE WITH DETECTED GROSS-ERRORS (LERR,
!        LCOMP, LSTAT MUST BE TRUE).                          YES
!  1     FILE TO HOLD PREDICTED SPHERICAL HARMONIC
!        COEFFICIENT CORRECTIONS NAMED PCOEFF                 YES
! INZ    UNIT FOR DATA INPUT, USE 22-38                       YES
! 99     TRANSFER OF ERROR-ESTIMATES FROM read_single_row
!        TO MAIN PROGRAM.                               YES
! 100    TRANSFER OF SOLUTIONS FROM read_single_column  YES
! > 100  CHUNK-FILES WITH SUFFIX .neq or .err.
! ------------------------------------------------------------------------------
!
! BRIEF SUMMARY OF INPUT SPECIFICATIONS. DETAILS ARE FOUND BELOW
! IN THE MAIN PROGRAM, WITH REFERENCE BACK TO THIS SUMMARY THROUGH
```

```
! THE NUMBERS (1), (2),.. ETC.
!
! (0) INPUT OF LOGICAL VARIABLE (LINTER), TRUE IF INTERACTIVE INPUT.
!     IF FALSE, ALL INPUT INSTRUCTIONS MUST BE STORED IN AN INPUT-FILE.
! (1) INPUT OF LOGICAL VARIABLES DETERMINING THE EXECUTION, AND
!     CONTINGENTLY NAMES OF FILES HOLDING RESTART-FILE, AND OF
!     NORMAL EQUATION FILES.
!     MOST IMPORTANT ARE:
!     LSPHER - THE COMPUTATIONS ARE MADE IN SPHERICAL APPROXIMATION.
!     LTRAN - DATA MAY HAVE TO BE TRANSFORMED FROM A LOCAL DATUM TO
!       GEOCENTRIC SYSTEM NOT ALREADY DEFINED IN SUBROUTINE ICOSYS.
!     LPOT  - FIRST OBSERVATION SET IS POTENTIAL COEFFICIENTS.
!     LPARAM- DATUM OR BIAS PARAMETERS TO DE DETERMINED.
!     LNCOL - NO COLLOCATION SOLUTIONS ARE WANTED.
!     LIOSOL- ESTABLISH OR USE RESTART FILES ON CHARACTER OR BINARY
!       FORM (UNITS 17, 18 AND 19).
!     IF LIOSOL IS TRUE, INPUT OF 5 LOGICAL PARAMETERS:
!     LWRSOL- WRITE RESTART FILE ON UNIT 17.
!     LBIPOT- WRITE BINARY FILE WITH POTENTIAL COEFFICIENTS ON UNIT 3.
!     LBICOV- OUTPUT COVARIANCE FUNCTION PARAMETERS ON BINARY FORM,
!     LBISOL- OUTPUT SOLUTION ON BINARY FORM,
!     LINSOL- INPUT CATALOGUE OF COVARIANCE FUNCTION PARAMETERS,
!       SOLUTIONS AND BOUNDARIES FOR VALIDITY OF SOLUTION ON BINARY
!       FORM. (1986.10.20 ONLY IMPLEMENTED ON RC8000).
!     LMTEST- GENERATES TEST-OUTPUT.
!     INTEGER NPROC, NUMBER OF THREADS TO BE USED.
! WHEN LNCOL IS FALSE:
!     INTEGER NN,NBB: BLOCK SIZE WITHIN CHUNK AND NUMBER OF BLOCKS
!       IN A CHUNK 'ROW'.
!     CHARACTER*128 DNANE(1,1), ROOT NAME FOR FILES.
! (2) INPUT OF PARAMETERS FOR GEOCENTRIC SYSTEM, (IF SYSTEM DEFINITION
!     NOT ALREAD GIVEN IN SUBROUTINE ICOSYS).
! (3) IF LTRAN IS TRUE INPUT OF PARAMETERS FOR SYSTEM IN WHICH DATA
!     CONTINGENTLY ARE GIVEN, AND PARAMETERS FOR TRANSFORMATION TO
!     GEOCENTRIC SYSTEM. THE SYSTEM IDENTIFICATION CODE IS 0 FOR THIS
!     SYSTEM.
! IF LINSOL IS TRUE, JUMP TO (9).
! (4) IF LPOT IS TRUE INPUT OF SPECIFICATIONS FOR POTENTIAL COEFFI-
!     CIENTS, INCLUDING A PARAMETER LFM, WHICH IS TRUE WHEN THE
!     COEFFICIENTS ARE IN THE STANDARD INPUT FILE (UNIT 5) AND
!     FALSE, IF THEY ARE INPUT THROUGH UNIT 9.
! (5) IF LFM IS TRUE INPUT OF COEFFICIENTS.
! IF LNCOL IS TRUE, JUMP TO (15)
! (6) GENERAL SPECIFICATION OF COVARIANCE FUNCTION TYPE. (SUBR. INCOV).
! (7) DETAILS CONCERNING COVARIANCE FUNCTION, AND CONTINGENTLY
!     CONCERNING TABLES USED FOR FAST INTERPOLATION OF VALUES.
! (8) IF LPARM IS TRUE SPECIFICATION OF PARAMETERS TO BE DETERMINED,
!     AND OF A SCRATCH FILE TO BE USED.
! (9) INPUT OF SPECIFICATION (FORMAT AND SEQUENCE OF ELEMENTS) OF
!     DATA SET, INCLUDING VALUE OF LIN4, TRUE IF THE OBSERVATIONS
!     ARE INPUT FROM UNIT INZ (NORMALLY EQUAL TO 4). (SUBR. DEFDAT
!     AND INHEAD).
! (10) IF LIN4 IS FALSE, THEN INPUT OF OBSERVATION RECORDS FROM
!     UNIT 5 ELSE FROM INZ. (SUBR. INP10).
! WHEN LAST RECORD IS ENCOUNTERED:
! (11) INPUT OF LSTOP, TRUE IF THE DATA SET IS THE FINAL ONE CONTRI-
!     BUTING TO THE CURRENT COLLOCATION STEP, AND OF LRESOL, TRUE
!     IF THE SOLUTIONS OR THE REDUCED NORMAL EQUATION MATRIX ARE
!     TO BE INPUT OR RE-USED, RESPECTIVELY.
! IF LSTOP IS FALSE, JUMP TO (9)
! (12) IF LRESOL IS TRUE, INPUT OF LSANEQ AND IFC. LSANEQ IS TRUE
!     IF THE IFC FIRST REDUCED COLUMS OF THE NORMAL EQUATIONS ARE
!     STORE.
! (13) IF IFC IS EQUAL TO THE TOTAL NUMBER OF OBSERVATIONS AND LRESOL
!     IS TRUE, INPUT OF THE SOLUTIONS. (OTHERWISE, THE LAST COLUMNS
!     WILL BE ESTABLISHED, REDUCED, AND THE EQUATIONS SOLVED).
! IF THE FIRST COLLOCATION STEP NOW IS TERMINATED, INPUT OF VARIABLES
! TELLING WHETHER A SECOND STEP SHOULD BE MADE, OTHERWISE JUMP TO (15).
! (14) INPUT OF LCREF, TRUE IF A SECOND STEP IS TO BE MADE AND OF
```

```
!     LPARM, TRUE IF PARAMETERS ARE TO BE DETERMINED IN A SECOND STEP.
! IF LCREF IS TRUE, THEN JUMP BACK TO (7).
! (15) INPUT OF LGRID, TRUE IF PREDICTIONS ARE TO BE MADE IN A GRID,
!     LERNO, TRUE IF ERRORS OF PREDICTION ARE TO BE COMPUTED OR RE-
!     PRODUCED IN OUTPUT (LNCOL TRUE), LCOMP, TRUE IF OBSERVED
!     AND COMPUTED QUANTITIES ARE TO BE COMPARED (DIFFERENCED) AND
!     LSPHAR, TRUE IF CORRECTIONS TO SPHERICAL HARMONIC COEFFICIENTS
!     ARE TO BE DETERMINED.
! IF LSPHAR OR LGRID ARE FALSE, THEN INPUT (9) AND (10), THEN JUMP TO (18).
! (16) INPUT OF GRID SPECIFICATIONS (START POINT, STEPS ETC.).
! (17) IF LCOMP IS TRUE, INPUT OF OBSERVATIONS IN THE GRID POINTS.
! (18) INPUT OF LSTOP. IF IT IS FALSE, JUMP TO (15), OTHERWISE
!     THE PROGRAM WILL TERMINATE.

!
! *************** INPUT (9) **********************************
!
! INPUT OF ONE DATA-SET OF OBSERVATIONS OR COORDINATES OF PREDICTION
! POINTS. ALL RECORDS MUST BE PUNCHED IN THE SAME WAY. THERE ARE THE
! FOLLOWING RESTRICTIONS AND OPTIONS: A STATION NUMBER MAY BE USED, BUT
! IT MUST OCCUPY THE FIRST DATAFIELD ON THE RECORD. THE TWO NEXT DATA-
! FIELDS MUST CONTAIN THE GEODETIC LATITUDE AND LONGITUDE ( IN AN ARBI-
! TRARY ORDER). IN CASE THE HEIGHT IS GIVEN, IT MUST BE PUNCHED IN THE
! NEXT DATAFIELD. THE FOLLOWING UP TO EIGHT DATAFIELDS WILL HAVE TO
! CONTAIN THE OBSERVED QUANTITY (OR QUANTITIES WHEN A PAIR OF DEFLECTI-
! ONS ARE OBSERVED) AND CONTINGENTLY THE STANDARD DEVIATIONS (WHEN
! LSA IS FALSE). ALSO PRECOMPUTED POTENTIAL COEFFICIENT AND TERRAIN
! POTENTIAL CONTRIBUTIONS MAY BE INPUT. THE LAST DATAFIELD MAY
! HOLD THE VALUE OF A LOGICAL VARIABLE LSTOP, TRUE FOR THE LAST
! RECORD IN THE FILE AND FALSE (I.E. BLANK ON MOST COMPUTERS) OTHERWISE.
! THIS IS ONLY USED IF NO STATION NUMBER IS INPUT. OR IF FREE-FORMAT
! INPUT IS USED FROM UNIT 5 (LIN4=.FALSE., SEE BELOW).
! IF A STATION NUMBER IS USED, THE END OF THE DATASET IS
! SUPPOSED TO HAVE BEEN REACHED, IF A NEGATIVE STATION NUMBER IS READ.
!
! ----------------------- INPUT (9) ------------------------------
!
! INPUT OF VARIABLES SPECIFYING THE CONTENT OF THE RECORDS. INO = 1,
! WHEN THE STATION NUMBER IS PUNCHED, 0 OTHERWISE, ILA, ILO THE NUMBER
! OF THE DATAFIELDS OCCUPIED BY THE LATITUDE AND THE LONGITUDE RESPEC-
! TIVELY, IANG  SPECIFYING UNITS OF ANGLES (1 FOR DEGREES, MINUTES, ARC-
! SECONDS, 2 FOR DEGREES, MINUTES, 3 FOR DEGREES AND 4 FOR 400-GRADES,
! 5 CARTESIAN COORD.
! IH = THE NUMBER OF THE DATAFIELD HOLDING THE HEIGHT (ZERO WHEN NO
! HEIGHT IS CONTAINED), IOBS1, IOBS2 = THE DATAFIELD NUMBER OF THE FIRST
! AND THE SECOND OBSERVATION, RESPECTIVELY (ZERO WHEN NO FIRST OR SECOND
! OBSERVATION), PLUS 10 TIMES THE RELATIVE POSITION OF A PRECOMPUTED
! POTENTIAL COEFFICIENT CONTRIBUTION, PLUS 100 TIMES THE RELATIVE
```

```
! POSITION OF A CONTRIBUTION FROM A TERRAIN POTENTIAL. EXAMPLE:
! SUPPOSE A RECORD CONSIST OF STATION NUMBER, LATITUDE, LONGITUDE,
! HEIGHT, KSI, STDV(KSI), PRECOMPUTED POTENTIAL COEFFICIENT CONTRI-
! BUTION AND PRECOMPUTED TERRAIN CONTRIBUTION, FOLLOWED BY THE
! SAME QUANTITIES FOR ETA. THEN INO=1,ILA=2,ILO=2,IH=4,IOBS1=435,
! IOBS2=438.
! NOTE, THAT IF STANDARD DEVIATIONS ARE PRESENT IN RECORD, THEY MUST
! FOLLOW JUST AFTER THE OBSERVATIONS. IF ONE OBSERVATION COMES RIGHT
! AFTER THE OTHER (IOBS2-IOBS1=1) THEN TWO STANDARD DEVIATIONS
! MUST FOLLOW THE SECOND OBSERVATION.
! IF IOBS1=0 AND PRECOMPUTED POTENTIAL COEFFICIENT OR TERRAIN
! CONTRIBUTIONS MUST BE INPUT, THEN THE POSITIONS OF THESE VALUES
! MUST BE GIVEN RELATIVE TO THE HEIGHT (IF PRESNENT) OR THE
! LONGITUDE/LATITUDE, DEPENDING ON WHICH ONE COMES LAST.
! THEN IKP, SPECIFYING THE KIND OF OBSERVATION, (1 FOR ZETA, 2
! FOR MEASURED GRAVITY, POINT OR MEAN GRAVITY ANOMALIES, 3 FOR KSI, 4
! FOR ETA AND 5 FOR PAIR OF DEFLECTIONS (KSI,ETA) OR (ETA,KSI),(IN THE
! SAME ORDER AS THE LATITUDE AND THE LONGITUDE)). ALSO THE CODES USED
! IN COVAX CAN BE USED, WITH 10 ADDED. IF CODES IKP EQUAL TO
! 26, 28, 30 AND 35 ARE USED, PAIRS OF QUANTITIES (16,17), (18,19),
! (20,21), (25,23) ARE COMPUTED.
!
! IN CASE LPARAM IS TRUE, OBSERVATIONS OF THE DIFFERENCE BETWEEN THE
! LOCAL GEODETIC AND THE GEOCENTRIC ELLIPSOIDAL HEIGHT (IKP = 6),
! OBSERVATIONS OF PAIRS OF DIFFERENCES BETWEEN THE GEOCENTRIC AND
! THE LOCAL GEODETIC LATITUDE AND LONGITUDE*COS(LATITUDE) (IKP = 7)
! CF. REF.(E), EQ.(12) - (14), AND SATELLITE ALTIMETER CROSS-OVER
! DIFFERENCES (IKP = 9) ARE ACCEPTED. IF A NEGATIVE VALUE OF IKP IS
! IS USED, THEN THE INPUT VALUE IS EQUAL TO THE OBSERVATION MINUS
! CONTINGENT CONTRIBUITIONS FROM POTENTIAL COEFFICIENTS, DATUM
! SHIFT OR COLLOCATION STEP 1. THIS IS USED, FOR EXAMPLE WHEN
! A RESTART-FILE IS INPUT.
!
! THEN ICSYS, AN INTEGER DEFINING THE COORDINATE SYSTEM. IF IT IS
! .LT. 0 THEN IT IS THE GEOCENTRIC (BEST) SYSTEM.
!
! THEN HP, THE MEAN HEIGHT OF THE POINTS (USED WHEN NO INDIVIDUAL
! HEIGHTS ARE GIVEN ), THE VALUES OF 10 LOGICAL VARIABLES:
!  LPUNCH  = PRINT OBS. OR PREDICTED VALUE AND CONTINGENTLY THEIR
!     DIFFERENCE, (OUTPUT TO UNIT 17).
!  LWLONG = LONGITUDE (AND ETA) ARE POSITIVE TOWARDS WEST.
!  LMEAN  = THE PREDICTED OR OBSERVED QUANTITY IS A MEAN GRAVITY VALUE.
!  LSA    = ALL OBSERVED QUANTITIES HAVE THE SAME STANDARD DEVIATION.
!     IN THIS CASE MUST THE COMMON VALUE (WM) BE INPUT SUBSEQUENTLY.
!  LKM    = THE HEIGHT IS IN UNITS OF KILOMETERS.
!  LADMU  = THE OBSERVATION HAS TO BE CORRECTED USING AN ADDITIVE
!           AND A MULTIPLICATIVE CONSTANT, AND IS CONTINGENTLY
!           AN ABSOLUTE VALUE (ONLY USABLE FOR GRAVITY AND
!           AND GRAVITY GRADIENTS PRESENTLY).
!  LSTAT  = STATISTICS OF DIFFERENCES BETWEEN OBSERVED AND PREDICTED
!     QUANTITIES ARE TO BE OUTPUT. THIS INCLUDES A PRIMITIVE HISTOGRAM
!    WITH 21 BINS. THE SIZE OF THE SAMPLING INTERVAL (VG) MUST BE INPUT
!    SUBSEQUENTLY.
!  LAREA  = ONLY DATA WITHIN GIVEN AREA ARE TO BE USED. LATITUDE AND
!    LONGITUDE BOUNDARIES MUST BE INPUT SUBSEQUENTLY.
!  LFORM  = VARIABLE FORMAT IS USED FOR DATA. FORMAT MUST BE INPUT
!    SUBSEQUENTLY, E.G. AS (I6,2F8.3,3F7.2,L2).
!  LIN4   = DATA  BE INPUT USING UNIT INZ. THE NAME OF THE FILE MUST
!    BE INPUT SUBSEQUENTLY, WITH THE VALUE OF INZ IF LFOR77 IS TRUE.
!
! SUPPLEMENTAL INFORMATION MUST BE GIVEN IN THE FOLLOWING SEQUENCE:
! (A)  NAME OF FILE CONNECTED TO UNIT INZ (LIN4 TRUE),
! (B)  IF LPUNCH IS TRUE, NAME OF FILE CONNECTED TO UNIT 17.
! (C)  FORMAT OF DATA RECORD (LFORM TRUE)
! (D)  VG, SAMPLING INTERVAL MAGNITUDE (LSTAT TRUE)
! (E)  WHEN LPARM IS TRUE: LEQP, TRUE WHEN ALL OBSERVATIONS DEPEND
!      ON THE SAME MP PARAMETERS. THEN MP AND IF LEQP IS TRUE THE PARA-
!      METER CODES. THEY MUST BE INPUT WITH THE DATA, IF LEQP IS FALSE.
! (F)  WHEN LADMU IS TRUE, AND IKP=2 OR 13 (GRAVITY), OR IKP=1 (HEIGHT
```

```
!      ANOMALY) OR IKP=10 (DENSITY ANOMALY), THEN INPUT OF A
!      MULTIPLICATIVE AND AN ADDITIVE CONSTANT AND LMEGR, TRUE IF
!      THE GRAVITY OR GRAVITY GRADIENT QUANTITY IS A MEASURED VALUE.
!      (IN THE CASE IKP=1 ONLY THE ADDITIVE CONSTANT HAS MEANING)
!      USED TO GET THE VALUES IN MGAL OR TO REMOVE BIAS (IKP=1) IF
!      NEEDED.
! (G)  LATITUDE AND LONGITUDE BOUNDARIES IF LAREA IS TRUE.
! (H)  IF LMEAN IS TRUE THEN AS (16C), LSIMH, BSIZEN, BSIZEE.
! (I)  IF LSA IS TRUE, THE  COMMON DATA ERROR, WM. (IT MUST BE FALSE
!      WHEN LERNO IS FALSE AND LNCOL OR LPRED ARE TRUE).
! (J)  IF IKP=10 (DENSITY CONTRAST), INPUT OF EXPONENT OF WEIGHT
!      FACTOR ON HARMONIC DENSITY AND RADIUS OF SPHERE INCLUDING MASSES.
! (K)  WHEN LSTAT, LERNO AND LCOMP ARE TRUE, INFORMATION ON SUSPECTED
!      GROSS-ERRORS MAY BE OUTPUT TO FORTRAN UNIT 24. THIS IS INDI-
!      CATED BY GIVING THE ERROR LEVEL (TYPICALLY 3.0). IF THIS IS
!      LARGER THAN 0.0, THEN THE FILE NAME MUST BE INPUT AS WELL.
! (L)  WHEN A ROTATED REFERENCE FRAME IS USED, IT MUST BE INDICATED
!      WHETHER THE ROTATION ONLY IS IN THE HORIZONTAL PLANE OR A FULL
!      ROTATION.
!
! IF OBSERVATION CODES LARGER THAN 10 ARE USED, HP WILL BE USED ONLY
! WHEN NO HEIGHT IS GIVEN EXPLICITLY FOR EACH POINT (IH = 0). HP IS

SUBROUTINE GRAVC(EE,MODE,I,UREF,GAMMA)
! PROGRAMMED NOV 1973 BY C.C.TSCHERNING, GEODETIC INSTITUTE OF
```

```
! DENMARK. LAST UPDATE FEB 1989 BY CCT.
!
! THE SUBROUTINE COMPUTES BY THE CONSTANTS TO BE USED IN
! THE FORMULA FOR THE NORMAL GRAVITY, THE FORMULA FOR THE NORMAL
! POTENTIAL AND THE CHANGE IN LATITUDE WITH HEIGHT. CONSTANTS RELATED TO
! TWO DIFFERENT REFERENCE FIELDS MAY BE USED. THEY ARE STORED IN THE
! ARRAY FG IN THE VARIABLES SUBSCRIPTED FROM 1 TO 15 FOR THE FIRST
! FIELD AND FROM 16 TO 30 FOR THE SECOND ONE. THE ARRAY FJ CONTAINS THE
! ZONAL HARMONICS, WITH SIGN OPPOSITE TO THE USUAL CONVENTIONS, CF
! REF(C), EQ. (2-92).
!
! THE SUBROUTINE MAY CALCULATE THE CONSTANTS IN 5 DIFFERENT WAYS
! BASED ON 3 VALUES STORED AT CALL IN EE(1), EE(2), EE(3):
! MODE=1: FROM GM, AX, J2 AND OMEGA,
! MODE=2: FROM GM, AX, E2 AND OMEGA,
! MODE=3: FROM GM, AX,1/F AND OMEGA,
! MODE=4: FROM GAMMA, 1/F, AX AND OMEGA, WHERE GAMMA IS THE NORMAL
!         GRAVITY AT EQUATOR.
! MODE=5: AS MODE=4, BUT WITH 1928 GRAVITY FORMULA.
! AX IS THE SEMI-MAJOR AXIS, F THE FLATTENING, E2 THE SQUARE OF THE
! EXCENTRICITY, OMEGA THE SPEED OF ROTATION, GAMMA THE EQUATORIAL
! GRAVITY AND GM THE PRODUCT OF THE GRAVITY CONSTANT AND THE MASS
! OF THE EARTH.

```
! ATION, WHICH IS EXECUTED USING THE SUBROUTINES COVBX AND COVCX.
!
! THE COVARIANCE FUNCTION USED IS DEFINED ACCORDING TO A DEGREE-VARIANCE
! MODEL AND A SET OF EMPIRICAL (POTENTIAL) DEGREE-VARIANCES. THE DEGREE-
! VARIANCE MODEL IS SPECIFIED THROUGH THE VALUES OF KI(1)-KI(5),CI(8)-
! CI(10) AND THE PARAMETERS N1 AND LOCAL OCCURRING IN THE COMMON BLOCK
! /CMCOV/. EMPIRICAL ANOMALY DEGREE-VARIANCES WILL HAVE TO BE STORED IN
! SIGMA0 WHEN LOCAL IS FALSE, AND ARE USED FOR THE COMPUTATION OF RESI-
! DUAL POTENTIAL DEGREE-VARIANCES, (SEE REF(A), EQ.(16)).
!
! BY THE CALL OF COVAX, THE KIND OF COVARIANCE FUNCTION TO BE USED IS
! DETERMINED. THE VALUE OF KI(5) WILL DETERMINE THE DEGREE-VARI-
! ANCE MODEL (1,2 OR 3, CF.REF(A),EQ.(17)) THAT WILL BE USED. THE QUAN-
! TITIES K(2),K(3) MUST BE STORED IN KI(3),KI(4), AND BE EQUAL TO ZERO
! WHEN NOT USED (EG.,KI(3),KI(4) BOTH ZERO WHEN KI(5)=1). THE QUANTITY
! A(I) MUST BE STORED IN CI(8) IN UNITS OF (M/SEC)**4, AND THE SQUARE OF
! THE RATIO BETWEEN THE RADIUS OF THE BJERHAMMAR-SPHERE (RB) AND THE
! MEAN RADIUS OF THE EARTH (RE) MUST BE STORED IN CI(10).
!
! THERE ARE THEN THREE POSSIBILITIES:
! (1) ONE OF THE DEGREE-VARIANCE MODELS IS USED WITHOUT MODIFICATIONS.
!     THE SUMMATION LIMIT P OF REF.(A),EQ.(20) IS THEN FIXED TO 3.
!     BECAUSE THIS IS EQUIVALENT TO REQUIRING THE FIRST 3 DEGREE-VARIAN-
!     AREA /CMCOV/ MUST BE EQUAL TO 3 AND .TRUE., RESPECTIVELY.
!     CES TO BE ZERO, THE VARIABLES N1 AND LOCAL STORED IN THE COMMON
! (2) A NUMBER (N1) OF THE ANOMALY DEGREE-VARIANCES (DEGREE ZERO TO
!     N1-1) ARE PUT EQUAL TO EMPIRICAL DETERMINED QUANTITIES. THE ANO-
!     MALY DEGREE-VARIANCE OF DEGREE K WILL HAVE TO BE STORED IN
!     SIGMA0(IS+K+1) IN UNITS OF MGAL**2 WHEN CALLING COVAX. LOCAL MUST
!     BE EQUAL TO FALSE. COVAX WILL CONVERT THE ANOMALY DEGRE5-VARIANCES
!     INTO POTENTIAL DEGREE-VARIANCES. THE POINTER IS MUST BE POSITIVE.
! (3) THE N1 FIRST DEGREE-VARIANCES (DEGREE 0 - N1-1) ARE EQUAL TO ZERO.
!     THIS MEANS, THAT THE VALUES OF A (N1-1)-ORDER LOCAL COVARIANCE
!     FUNCTION WILL BE COMPUTED. LOCAL MUST HAVE THE VALUE .TRUE..
! IN ALL CASES N1 MUST BE LESS THAN 300.
!
! THE COVARIANCES WILL GENERALLY BE COMPUTED BY CLOSED EXPRESSIONS, BUT
! THEY MAY IN CERTAIN CASES BE USELESS IN BIG ALTITUDES OF NUMERICAL
! REASONS, CF. REF(A), SECTION 4. IN THEESE CASES MUST THE LOGICAL VARI-
! ABLE LSUM BE TRUE AND THE VARIABLE HMAX MUST HAVE ASSIGNED A VALUE
! EQUAL TO THE CRITICAL ALTITUDE. WHEN LSUM IS TRUE AND THE HEIGHT OF
! P OR Q IS GREATHER THAN HMAX, WILL THE SERIES REF(A), EQ.(16), ABBRE-
! VIATED TO DEGREE N2-1 BE USED FOR THE COMPUTATION OF THE COVARIANCES.
! THE VALUES OF LSUM, N2 AND HMAX WILL (IN THE SAME WAY AS FOR THE PARA-
! METERS SPECIFYING THE DEGREE-VARIANCE MODEL) BE TRANSFERRED TO COVAX
! THROUGH THE COMMON AREA /CMCOV/, BUT AN ARRAY SM IS TRANSFERRED AS A
! PARAMETER IN THE CALL IN ORDER TO ENABLE VARIABLE DIMENSIONING (SPECI-
! FIED BY THE VARIABLE N2 IN /CMCOV/).
!
! THE CALL OF COVAX WILL ALSO INITIALIZE CERTAIN VARIABLES USED IN
! SUBSEQUENT COMPUTATIONS.

! THE COMMON BLOCK CONTAINS THE VALUES OF PARAMETERS USED FOR THE COM-
! PUTATIONS AND RETURN VALUES OF FUNCTIONS AND CONSTANTS, WHICH HAVE
! BEEN USED IN THE COMPUTATIONS.
! PARAMETERS USED FOR THE COMPUTATIONS:
!   CI(8) = THE CONSTANT A(I) OF REF.(A), EQ.(17) IN UNITS OF (M/SEC)**4
!   CI(10) THE SQUARE OF THE RATIO BETWEEN THE BJERHAMMAR-SPHERE RADIUS
!   (RB) AND THE MEAN RADIUS OF THE EARTH (RE), OR IF NEGATIVE RB-RE,
!   (CHANGE MADE 3 JULY 1985).
!   CI(13) USER DEFINED VALUE OF CI(11). CI(14), CI(15) USER DEFINED
!   VALUES OF CI(21) - CI(24).
!   SIGMA0(IS+1)-SIGMA0(IS+N1) MUST CONTAIN THE POTENTIAL ANOMALY
!   DEGREE-VARIANCE CORRECTIONS, CF. REF.(A), EQ.16.
!   KI(3) = K(2) OF DEG.VAR. MODEL 2 OR 3,
!   KI(4) = K(3) OF DEG.VAR. MODEL 3, CF. REF.(A), EQ.(17).
```

```
!   KI(5) = THE DEG.VAR. MODEL NUMBER, (EQUAL TO 1, 2 OR 3),
!   KI(6),KI(7) THE INTEGER SPECIFYING THE KIND OF QUANTITY WHICH IS
!   ASSOCIATED WITH P, Q, RESPECTIVELY,
!   KI(26) − KI(34) USER SPECIFIED VALUES FOR KI(10) − KI(23).
!   KI(35) − KI(37) USED BY SUBROUTINE COVCG FOR STATISTICAL PURPOSES.
!   N1 = THE NUMBER OF EMPIRICAL DEGREE−VARIANCES USED (LOCAL =.FALSE.)
!   OR (ORDER+1) OF THE LOCAL COVARIANCE FUNCTION USED (LOCAL=.TRUE.).
!   HMAX, N2, LSUM. HMAX IS THE HEIGHT ABOVE WHICH THE LEGENDRE SERIES
!   OF MAXIMAL DEGREE N2−1 WILL BE USED FOR THE COMPUTATION OF THE CO−
!   GREATHER THAN N1.
! RETURN VALUES:
!   CI(1)−CI(7), THE QUANTITIES C(J,Q) OF REF.(A), EQ.(47), WITH
!   CI(1) − CI(KI(5)+1) = C(J,Q), CI(5) = C(KI(5)+2,Q),
!   CI(6) = C(KI(5)+3,Q), CI(7) = C(KI(5)+4,Q),
!   CI(11),CI(12) QUANTITIES USED TO GIVE THE COMPUTED
!   COVARIANCES THE PROPER UNITS.
!   CI(21) − CI(24) THE QUANTITIES M(1) − M(4) OF REF.(A) EQ. (26) −
!   (29). (CHANGE MADE 1986.10.20).
!   SIGMA(IS+4) − SIGMA(IS+N1), THE POTENTIAL DEGREE−VARIANCES MULTI−
!   PLIED BY THE FACTORS GIVEN IN REF.(A), TABLE 1.
!   SIGMA(IS+1) − SIGMA(IS+3), THE DEGREE−VARIANCES OF DEGREE 0,1,2
!   MINUS TERMS OF THE SAME DEGREES ACQUIRED FROM REF.(A), EQ.(34),(35),
!   (41) AND (42).
!   KI(8),KI(9) THE NUMBER OF DIFFERENTIATIONS IN RADIAL DIRECTION AND
!   WITH RESPECT TO T = COS(SPHERICAL DIST.) TO BE PERFORMED.
!   KI(10) − KI(15) THE CONSTANTS I,K,J,M,J1,M1 OF REF.(A), SECTION 2.
!   KI(16) − KI(19) THE QUANTITIES M(1) − M(4) OF REF.(A), EQ.(26)−(29).
!   KI(20),KI(21) THE EXPONENT OF THE REFERENCE GRAVITY,
!   KI(22),KI(23) THE EXPONENT OF THE RADIAL DISTANCE AND
!   KI(24),KI(25) SUBSCRIPTS OF THE RESULT STORED IN CV (COMMON CMCOV).
!
! CHANGE 2010−11−23. and 2011−03−26.
!     DIMENSION SM(2001),SIGMAX(400,5)
! THE ARRAY SM IS USED TO STORE THE DEGREE−VARIANCES WHEN THE LOGICAL
! VARIABLE LSUM IS TRUE. IN CASE THE SUBSCRIPT LIMIT IS CHANGED IS IT
! NECESSARY TO CHANGE THE VALUE OF THE VARIABLE N2 ACCORDINGLY.
!
! SIGMAX IS USED TO HOLD DEGREE−VARIANCES OF RADIAL DERIVATIVES
! UP TO ORDER 2 IN P AND Q. (CHANGE MAY 1991).
!
! THE ARRAYS K7 − K23 CONTAINS TABLES OF QUANTITIES RELATED TO THE KIND
! OF COVARIANCES (1 − 14) WHICH MAY BE COMPUTED. THEIR ACTUAL VA−
! LUES WILL AFTER CALL OF COVBX BE STORED IN THE ELEMENTS OF THE ARRAY
! KI HAVING SUBSCRIPTS 8 − 25.
! K7 CONTAINS THE ORDER OF DIFFERENTIATION WITH RESPECT TO T,K8 THE
! ORDER OF DIFFERENTIATION WITH RESPECT TO THE RADIUS, CF.REF(A),TABLE
! 1. K9,K11,K13 THE KIND OF DIFFERENTIATIONS TO BE COMPUTED WITH RESPECT
! TO THE LATITUDE (2) AND THE LONGITUDE (3), CF.REF(A),SECTION 3. K15
! AND K17 CONTAINS AN INTEGER, WHICH WILL BE ADDED TO THE DEGREE. THE
! SUM WILL THEN BE MULTIPLIED WITH THE DEGREE−VARIANCE OF THE CORRESPON−
! DING DEGREE WHEN A FIRST AND/OR SECOND DIFFERENTIATION WITH RESPECT
! TO THE RADIAL DISTANCE HAS TAKEN PLACE.
! C11 CONTAIN QUANTITIES USED TO GIVE THE COVARIANCES THE PROPER UNITS.

 END SUBROUTINE COVBX
!
SUBROUTINE COVCX(SM,COV,COVX,IS,LSAT)
! ORIGINALLY PROGRAMMED JULY 1975 BY C.C.TSCHERNING AS A SUB-
! ENTRY TO COVAX. SEPARATE SUBROUTINE CREATED SEPT 1987 BY CCT.
! LATEST MODIFICATION 2013-03-25   BY CCT.
!
! COMPUTATION OF THE COVARIANCE IN A SPECIFIC PAIR OF POINTS, OR
! BETWEEN A FUNCTIONAL ASSOCIATED WITH A POINT AND A SPHERICAL-HARMONIC
! COEFFICIENT. THE  VALUE IS RETURNED THROUGH THE PARAMETER COV.
! THE COVARIANCES COMPUTED WILL BE IN UNITS CORRESPONDING TO THE KIND
! OF QUANTITIES, I.E. FOR KIND (1) METERS, (2) EOTVOS (E), (3) MGAL,
! (4),(5) E, (6),(7) ARCSECONDS, (8) - (14) E, (17) UNITLESS.
! THE FOLLOWING QUANTITIES MUST BE STORED IN THE ELEMENTS OF THE ARRAY
! CR WHEN COVCX IS CALLED: (1) COSINE TO THE SPHERICAL DISTANCE BET-
! WEEN P AND Q, (2),(3) THE HEIGHT OF P, Q RESPECTIVELY, (4),(5) SINE
! OF THE LATITUDE THE  OF P, Q, RESPECTIVELY, (6),(7) COSINE OF THE
! LATITUDE OF P, Q, RESPECTIVELY, (8),(9) SINE AND COSINE OF THE
! LONGITUDE DIFFERENCE. THE REFERENCE GRAVITY WILL HAVE TO BE STORED
! IN CR(10),CR(11) FOR P, Q RESPECTIVELY (WHEN USED, OTHERWISE STORE
! 1.0). FOR KIND 17, COS AND SIN OF LONGITUDES MUST BE STORED IN THE
! COMMON BLOCK /PDEGV/.
!
! THE CALL OF COVCX WILL RESULT IN THE COMPUTATION OF THE COVARIANCE ,
! WHICH IS TRANSFERRED TO THE CALLING PROGRAM THROUGH THE VARIABLE COV.
! THE RESULT WILL ALSO BE TRANSFERRED IN THE COMMON CMCOV, BY THE ARRAY
! CV(2,2). IN CASE IT IS POSSIBLE TO COMPUTE MORE THAN ONE QUANTITY AT
! A TIME (I.E. WHEN DERIVATIVES WITH RESPECT TO T=COS(SPHERICAL DIST-
```

```
! TANCE) ARE COMPUTED, KINDS 6 - 11, 13 AND 15), THE COVARIANCE
! OF TYPE 6, 8, 10 AND 23 WILL BE STORED IN THE ELEMENT WITH SUBSCRIPT
! 2 AND OTHERWISE IN THE ELEMENT WITH SUBSCRIPT 1. THE KIND OF THE
! FUNCTIONALS IN P WILL DETERMINE THE VALUE OF THE FIRST SUBSCRIPT
! WHILE THE KIND OF THE FUNCTIONALS IN Q WILL DETERMINE THE SECOND
! SUBSCRIPT. EXAMPLE: KIND 6 IN P AND KIND 1 IN Q WILL DELIVER
! THE COVARIANCE BETWEEN THE PRIME-VERTICAL VERTICAL DEFLECTION AND
! AND THE HEIGHT ANOMALY IN CV(1,1), BETWEEN THE MERIDIAN VERTICAL
! DEFLECTIAN AND THE HEIGHT ANOMALY IN CV(2,1).
!
! WHEN LSAT IS TRUE, THE 4D ARRAY COVX HOLDS THE VECTORS OR MATRICES
! OF COVARIANCES BETWEEN ALL 0, 1 OR 2 DERIVATIVES.

! THE COMMON BLOCK CONTAINS THE VALUES OF PARAMETERS USED FOR THE COM-
! PUTATIONS AND RETURN VALUES OF FUNCTIONS AND CONSTANTS, WHICH HAVE
! BEEN USED IN THE COMPUTATIONS.
! PARAMETERS USED FOR THE COMPUTATIONS:
!   CI(8) = THE CONSTANT A(I) OF REF.(A), EQ.(17) IN UNITS OF (M/SEC)**4
!   CI(10) THE SQUARE OF THE RATIO BETWEEN THE BJERHAMMAR-SPHERE RADIUS
!   (RB) AND THE MEAN RADIUS OF THE EARTH (RE), OR IF NEGATIVE RB-RE,
!   (CHANGE MADE 3 JULY 1985).
!   CI(13) USER DEFINED VALUE OF CI(11). CI(14), CI(15) USER DEFINED
!   VALUES OF CI(21) - CI(24).
!   NEW VARIABLES ADDED MAY 1, 1986 AND NOV 1986:
!   CI(16) - CI(24), WHERE CI(20)=0.0 IF PRECISE FORMULAE FOR DERIVATIVES
!   MAY BE USED. IN THIS CASE IS CI(16)=SIN(LONGITUDE DIFFERENCE/2)**2,
!   CI(17)=SIN(LATITUDE DIFFERENCE/2), CI(18)=COS(LATITUDE DIFFERENCE),
!   CI(19)=COS(LATITUDE DIFFERENCE/2). OTHERWISE CI(20)=1.0.
!   CR(2),CR(3) THE HEIGHT OF P, Q, RESPECTIVELY, (UNITS METERS),
!   CR(4),CR(5) SINE OF THE LATITUDE OF P, Q, RESPECTIVELY,
!   CR(6),CR(7) COSINE OF THE LATITUDE OF P, Q, RESPECTIVELY,
!   CR(8),CR(9) SINE AND COSINE OF THE LONGITUDE DIFFERENCE,
!   CR(10),CR(11) THE REFERENCE GRAVITY IN P, Q, RESPECTIVELY (WHEN
!   USED, OTHERWISE STORE 1.0E0), (UNITS M/SEC**2).
!   KI(3) = K(2) OF DEG.VAR. MODEL 2 OR 3,
!   KI(4) = K(3) OF DEG.VAR. MODEL 3, CF. REF.(A), EQ.(17).
!   KI(5) = THE DEG.VAR. MODEL NUMBER, (EQUAL TO 1, 2 OR 3),
!   KI(6),KI(7) THE INTEGER SPECIFYING THE KIND OF QUANTITY WHICH IS
!   ASSOCIATED WITH P, Q, RESPECTIVELY,
!   KI(26) - KI(34) USER SPECIFIED VALUES FOR KI(10) - KI(23).
!   KI(35) - KI(37) USED BY SUBROUTINE COVCG FOR STATISTICAL PURPOSES.
!   N1 = THE NUMBER OF EMPIRICAL DEGREE-VARIANCES USED (LOCAL =.FALSE.)
!   OR (ORDER+1) OF THE LOCAL COVARIANCE FUNCTION USED (LOCAL=.TRUE.).
!   HMAX, N2, LSUM. HMAX IS THE HEIGHT ABOVE WHICH THE LEGENDRE SERIES
!   OF MAXIMAL DEGREE N2-1 WILL BE USED FOR THE COMPUTATION OF THE CO-
!   VARIANCES WHEN LSUM IS TRUE. N2 MUST BE GREATHER THAN 2 AS WELL AS
!   GREATHER THAN N1.
! RETURN VALUES:
!   CR(ND*8+12), THE VALUES OF THE ND'TH DERIVATIVE OF THE SUM OF THE
!   FINITE LEGENDRE-SERIES, CF.REF.(A), EQ.(20),(48) AND (52).
!   CR(ND*8+13) - CR(ND*8+19), THE VALUES OF THE ND'TH DERIVATIVES OF
!   THE FUNCTIONS F(-2), F(-1), F(KI(3)), F(KI(4)), S0, S1, S2, CF. REF.
!   (A), EQ. (42), (41), (39), (39), (30), (34) AND (35).
!   SIGMA0(IS+1) - SIGMA0(IS+N1) THE POTENTIAL DEGREE-VARIANCE
!   CORRECTIONS, CF. REF.(A), EQ.(16), (AFTER THE CALL OF COVAX).
!   SIGMA(IS+4) - SIGMA(IS+N1), THE POTENTIAL DEGREE-VARIANCES MULTI-
!   PLIED BY THE FACTORS GIVEN IN REF.(A), TABLE 1.
!   SIGMA(IS+1) - SIGMA(IS+3), THE DEGREE-VARIANCES OF DEGREE 0,1,2
```

```
!   MINUS TERMS OF THE SAME DEGREES ACQUIRED FROM REF.(A), EQ.(34),(35),
!   (41) AND (42).
!   KI(8),KI(9) THE NUMBER OF DIFFERENTIATIONS IN RADIAL DIRECTION AND
!   WITH RESPECT TO T = COS(SPHERICAL DIST.) TO BE PERFORMED.
!   KI(10) - KI(15) THE CONSTANTS I,K,J,M,J1,M1 OF REF.(A), SECTION 2.
!   KI(16) - KI(19) THE QUANTITIES M(1) - M(4) OF REF.(A), EQ.(26)-(29).
!   KI(20),KI(21) THE EXPONENT OF THE REFERENCE GRAVITY,
!   KI(22),KI(23) THE EXPONENT OF THE RADIAL DISTANCE AND
!   KI(24),KI(25) SUBSCRIPTS OF THE RESULT STORED IN CV (COMMON CMCOV).
